

THE SECURITY ORACLE™

APPOINTMENT APPROVED: 11:00 AM AT FERC DC HQ

MISSION: To identify and secure the nation's critical infrastructure via a proven risk analysis process, the application of reliable integrated and interoperable protection systems and custom design to counter the threats.

What the 3300 NERC OWNERS are worried about:

- **Being attacked**
- **Negatively impacting reliability and customer confidence**
- **Exorbitant security expenditures driven by new FERC security standards**
- **Newly required safeguards not working any better than existing 'passive' systems**

What they need right now:

- **A way to know what level of security is fiscally reasonable for each condition or facility**
- **Effective means to determine their security risks and cost effective solutions to reduce those risks to a level acceptable to them under the new FERC standards**

We are well practiced at conducting and implementing the results of a risk assessment methodology that fully complies with the latest FERC regulations AND will bring electric power owners into full compliance at the most cost effective means possible.
